The D-Carie mini--quick, easy, accurate caries detection  
The D-Carie mini is a lightweight, easy-to-use, cordless device that can be used as an aid for clinicians to quickly locate and diagnose caries. The D-Carie mini uses Light Emitting Diode and fiber optic technologies and is FDA approved as a diagnostic aid for the detection of interproximal and occlusal caries. The device requires no calibration and is easy to sterilize.

The D-Carie mini--quick, easy, accurate caries detection  
The D-Carie mini is a lightweight, easy-to-use, cordless device that can be used as an aid for clinicians to quickly locate and diagnose caries. The D-Carie mini uses Light Emitting Diode and fiber optic technologies and is FDA approved as a diagnostic aid for the detection of interproximal and occlusal caries. The device requires no calibration and is easy to sterilize.

The D-Carie miniT detects more than 92 percent of occlusal caries and more than 85 percent of interproximal caries. Using only X-rays and dental explorers, dentists can overlook approximately half of incipient caries. When used as a diagnostic aid in conjunction with an X-ray, the D-Carie mini allows dentists to assess a third dimension--the volume of caries--prior to opening the tooth.

Using only X-rays and dental explorers, dentists can overlook approximately half of incipient caries. When used as a diagnostic aid in conjunction with an X-ray, the D-Carie mini allows dentists to assess a third dimension--the volume of caries--prior to opening the tooth.

The device also provides dentists with an option for examining and diagnosing children, pregnant women and patients who prefer to forgo X-rays or limit their exposure to them for health or personal reasons.

The device also provides dentists with an option for examining and diagnosing children, pregnant women and patients who prefer to forgo X-rays or limit their exposure to them for health or personal reasons.

The DetecTar mini--intelligent sub-gingival calculus detection  
The DetecTar mini is the first and only cordless intelligent diagnostic aid to assist clinicians in the accurate detection of sub-gingival calculus. The DetecTar mini helps dentists, hygienists and periodontists to locate and diagnose calculus quickly and accurately.

periodontal probes and has been shown to reduce over-detection by 64 percent.

Based on state-of-the-art Light Emitting Diode and fiber optic technologies, the DetectTar mini detects up to three times more calculus (91 percent sensitivity) than traditional periodontal probes and has been shown to reduce over-detection by 64 percent.

Studies have shown that most adults over the age of 30 have calculus. According to a National Institute of Dental Research study, tartar buildup is prevalent in more than 90 percent of individuals examined where 67 percent of the participants had some sub-gingival calculus.

Calculus left untreated can further progress to gum disease and can result in tooth loss. Research has also found that a person's total health is often related to their oral health.

Calculus left untreated can further progress to gum disease and can result in tooth loss. Research has also found that a person's total health is often related to their oral health.

These studies have shown a strong link between periodontal disease and serious health issues such as heart disease, diabetes, stroke, ulcers and low pre-term birth weight. The DetectTar mini helps reduce the incidence of developing these conditions by helping clinicians to accurately locate and remove calculus early in order to prevent further progression of gum disease.
